Huawei Symantec

Huawei Symantec PowerSteering™ for VMware

Huawei Symantec is optimizing data center infrastructure in virtualized environments by integrating their products with the emerging management capabilities of VMware. Unlike major infrastructure providers with management software that competes with VMware, Huawei Symantec empowers data center managers to maximize the use of hypervisors to take over control of their data centers, their costs and their futures. To achieve this goal, the company offers the Huawei Symantec PowerSteering™ Architecture, and Huawei Symantec PowerSteering™ for VMware – a suite of plug-ins which allow administrators to manage Huawei Symantec storage systems from their vCenter console.

PowerSteering for VMware Architecture

The linkage which PowerSteering provides from storage to VMware is transparent, and the rough “Manual Steering” previously used to manage storage, is replaced by smooth “Power Steering” from a single vCenter console.
